New ProPortion™ Dispenser is Available for Purchase

Richfield, WI (October 1, 2019) – Server Products is officially offering the new ProPortion™ Dispenser for purchase. Preordering for this product became available in July, but now foodservice customers can purchase through regular distribution channels. Select e-commerce partners can be accessed by visiting proportiondispenser.com.

Customers are able to choose from a single or triple tip ProPortion Dispenser. Each unit comes with color-coded valves and portion tabs. The valves are available in small, medium and large options for dispensing different viscosities. And the 6 color-coded portion tabs come in ¼-, ⅓-, ½-, ⅔-, ¾- and 1-ounce sizes.

During operator testing, Aaron Sloma emphasized the versatility that the ProPortion offers. “A great thing is the ability to use ProPortion with so many different products without there being any issues regarding thickness. That’s very appealing to us,” he said. Owner and operator or Viand Hospitality, Sloma tested the dispenser in both his Parker John’s BBQ & Pizza and Log Cabin Restaurants locations.

ProPortion customers may also expect consistency and cost effectiveness. “The biggest benefit is consistency with every sandwich,” Sloma adds. “For us, there is cost savings due to the portion control, but what’s most important is the consistency ProPortion brings across our brand.”

Portion controlled dispensing can result in use of considerably less product with fewer pauses to refill dispensers. “This product was designed with operators in mind; we wanted to give them precision and accuracy without complicated training or additional ongoing labor,” says Brian Kopeny, Product Solutions Specialist at Server Products. Both the product and labor efficiencies can save an operation up to $500 per dispenser.

To increase food safety, the ProPortion™ has an elevated bottom that prevents the dispensing tip from coming into contact with preparation surfaces in the kitchen. Sloma appreciates that this feature “reduces the risk of cross contamination.”
