

Stainless Steel Pump Update

Product Enhancements

Along with our long-standing commitment to providing unique solutions to your dispensing challenges, we work hard to control costs and improve efficiencies. Since its creation, our flagship Stainless Steel Pump has seen a few revisions, and we are dedicated to continuing to make improvements throughout 2019 to reduce cost without compromising quality. These rolling updates to all pump families will be completed by the end of 2019.

Modified End Forming Process

By changing the discharge tube end forming process, we were able to eliminate a step, which helps control labor time and ultimately, cost. While this change results in up to 1/4" longer discharge tube end depending on pump model, the functionality will remain the same.

Transition to Nutless Discharge Tube

A rolling change will affect all of our stainless steel pump models in the future: the nutless discharge tube. This change eliminates a part which helps control costs, and reduces the amount of potentially lost parts during cleaning.
